

# Summarising datasets in Excel

# Learning intentions

We will be learning to summarise datasets in Excel, specifically to

- calculate the **total, count, min/max** and **average** of rows data
- **group rows of data** based on logical criteria
- perform **calculations on grouped data**

# Background

When trying to solve a problem in data science understanding the data you have is fundamental.

**Rows of data** can be **filtered** and **sorted** to help you understand your data.

In this lesson we will look at how you can also **summarise and group rows of data**.

# Why this is important?

Some benefits of grouping and summarising data are,

Makes the data **easier to work** with

**Focus** on the important messages

Allows you to **simplify** your dataset

Helps you **describe** your data, e.g., What is the total? How many rows do you have?

# Definition

## **Summarise**

To condense the rows in a dataset  
(often to a single value) by  
performing a calculation on the data  
items within a variable.

# Summarising data

In the similar way that you can perform calculations on columns of data, you can **perform calculations on rows of data.**

The most common calculations performed on rows of data are,

- Count (number of rows)
- Total
- Average

# Show me...

The new rows created by summarising are often shown as a separate dataset.

Original dataset

| animal   | age_yrs |
|----------|---------|
| Lion     | 10      |
| Tiger    | 2       |
| Elephant | 15      |
| Penguin  | 3       |
| Parrot   | 5       |

Summarise

Summarised dataset

| summary        | age_yrs |
|----------------|---------|
| Count          | 5       |
| Total          | 35      |
| Average (mean) | 7       |

# Show me...

When you are summarising a dataset you can **select the required variables** and then **summarise them**.

| month | number_sold | price | income |
|-------|-------------|-------|--------|
| Jan   | 6           | 41    | 246    |
| Feb   | 5           | 27    | 135    |
| Mar   | 4           | 46    | 184    |
| Apr   | 6           | 28    | 168    |
| May   | 2           | 41    | 82     |

Summarise

| total_number_sold | total_income |
|-------------------|--------------|
| 23                | 851          |

# Example

This dataset shows the test results for 5 pupils. Summarise the test results in this dataset by calculating,

- Count
- Average (mean)
- Maximum test score
- Minimum test score

| pupil_ID | test_1 | test_2 | test_3 |
|----------|--------|--------|--------|
| GH1254   | 50%    | 36%    | 72%    |
| SE1547   | 45%    | 64%    | 94%    |
| DM4758   | 90%    | 48%    | 78%    |
| KL4758   | 32%    | 93%    | 52%    |
| PM4575   | 85%    | 86%    | 92%    |

# Example

Summarise the test results in this dataset.

Original dataset

| pupil_ID | test_1 | test_2 | test_3 |
|----------|--------|--------|--------|
| GH1254   | 50%    | 36%    | 72%    |
| SE1547   | 45%    | 64%    | 94%    |
| DM4758   | 90%    | 48%    | 78%    |
| KL4758   | 32%    | 93%    | 52%    |
| PM4575   | 85%    | 86%    | 92%    |

Summarised dataset

| summary | test_1 | test_2 | test_3 |
|---------|--------|--------|--------|
| Count   | 5      | 5      | 5      |
| Average | 60%    | 65%    | 78%    |
| Maximum | 90%    | 93%    | 94%    |
| Minimum | 32%    | 36%    | 52%    |

# Your turn...

What do you think the **count**, **maximum** and **minimum** would be in this dataset?

| ocean    | depth_m |
|----------|---------|
| Pacific  | 3,970   |
| Atlantic | 3,646   |
| Indian   | 3,741   |
| Arctic   | 1,205   |

# Your turn...

What do you think the **count**, **maximum** and **minimum** would be in this dataset?

| ocean    | depth_m |
|----------|---------|
| Pacific  | 3,970   |
| Atlantic | 3,646   |
| Indian   | 3,741   |
| Arctic   | 1,205   |

Summarise

| summary | depth_m |
|---------|---------|
| Count   | 4       |
| Maximum | 3,970   |
| Minimum | 1,205   |

# Summarise in Excel

We are now going to look at summarising datasets in Excel.

The table below shows the formulas we will need for this.

| Calculation    | Formula               |
|----------------|-----------------------|
| Total          | =sum(A,B,C,D...)      |
| Maximum        | =max(A,B,C,D....)     |
| Minimum        | =min(A,B,C,D,...)     |
| Average (mean) | =average(A,B,C,D,...) |
| Count          | =count(A,B,C,D,...)   |

# Summarising in Excel

Step 1.

Create a new dataset with the variable headings you have selected and **row labels for summary types** you will calculate.

|    | A       | B      | C      | D      | E |
|----|---------|--------|--------|--------|---|
| 1  | ID      | test_1 | test_2 | test_3 |   |
| 2  | GH1254  | 50%    | 36%    | 72%    |   |
| 3  | SE1547  | 45%    | 64%    | 94%    |   |
| 4  | DM4758  | 90%    | 48%    | 78%    |   |
| 5  | KL4758  | 32%    | 93%    | 52%    |   |
| 6  | PM4575  | 85%    | 86%    | 92%    |   |
| 7  |         |        |        |        |   |
| 8  |         |        |        |        |   |
| 9  | ID      | test_1 | test_2 | test_3 |   |
| 10 | Count   |        |        |        |   |
| 11 | Minimum |        |        |        |   |
| 12 | Maximum |        |        |        |   |
| 13 | Average |        |        |        |   |
| 14 |         |        |        |        |   |
| 15 |         |        |        |        |   |

# Summary formulas in Excel

Step 2.

Type in the calculation you will use to summarise the data.

|    | A       | B             | C      | D      |
|----|---------|---------------|--------|--------|
| 1  | ID      | test_1        | test_2 | test_3 |
| 2  | GH1254  | 50%           | 36%    | 72%    |
| 3  | SE1547  | 45%           | 64%    | 94%    |
| 4  | DM4758  | 90%           | 48%    | 78%    |
| 5  | KL4758  | 32%           | 93%    | 52%    |
| 6  | PM4575  | 85%           | 86%    | 92%    |
| 7  |         |               |        |        |
| 8  |         |               |        |        |
| 9  | ID      | test_1        | test_2 | test_3 |
| 10 | Count   | =count(B2:B6) |        |        |
| 11 | Minimum |               |        |        |
| 12 | Maximum |               |        |        |
| 13 | Average |               |        |        |
| 14 |         |               |        |        |

# Copy formulas

Step 3.

**Copy the calculation** you have just typed into the first variable, and paste into the remaining variables of the new row.

|    | A       | B      | C      | D             |
|----|---------|--------|--------|---------------|
| 1  | ID      | test_1 | test_2 | test_3        |
| 2  | GH1254  | 50%    | 36%    | 72%           |
| 3  | SE1547  | 45%    | 64%    | 94%           |
| 4  | DM4758  | 90%    | 48%    | 78%           |
| 5  | KL4758  | 32%    | 93%    | 52%           |
| 6  | PM4575  | 85%    | 86%    | 92%           |
| 7  |         |        |        |               |
| 8  |         |        |        |               |
| 9  | ID      | test_1 | test_2 | test_3        |
| 10 | Count   | 5      | 5      | =COUNT(D2:D6) |
| 11 | Minimum |        |        |               |
| 12 | Maximum |        |        |               |
| 13 | Average |        |        |               |
| 14 |         |        |        |               |

# Summarise in Excel

Step 4.

**Repeat** the process for any other summary calculations you need.

|    | A       | B      | C      | D               |
|----|---------|--------|--------|-----------------|
| 1  | ID      | test_1 | test_2 | test_3          |
| 2  | GH1254  | 50%    | 36%    | 72%             |
| 3  | SE1547  | 45%    | 64%    | 94%             |
| 4  | DM4758  | 90%    | 48%    | 78%             |
| 5  | KL4758  | 32%    | 93%    | 52%             |
| 6  | PM4575  | 85%    | 86%    | 92%             |
| 7  |         |        |        |                 |
| 8  |         |        |        |                 |
| 9  | ID      | test_1 | test_2 | test_3          |
| 10 | Count   | 5      | 5      | =COUNT(D2:D6)   |
| 11 | Minimum | 32%    | 36%    | =MIN(D2:D6)     |
| 12 | Maximum | 90%    | 93%    | =MAX(D2:D6)     |
| 13 | Average | 60%    | 65%    | =AVERAGE(D2:D6) |
| 14 |         |        |        |                 |

## Next steps

Complete **questions 1 to 6**  
in **section 1** of the  
'Summarising datasets in  
Excel' workbook.

# Definition

## **Group**

To split a dataset into sets of rows based on some criteria.

# Show me...

These animals have been **grouped by colour**

# Grouping data

In the last section we looked at summarising all the rows in a dataset.

Now we are going to look at how to split datasets into sets of rows then **summarise these groups of rows**.

In data science, it is more usual (and useful) to summarise grouped data.

# Grouping data

When grouping data it can help to think about the following questions,

What **data** do I have?

What do you **need** from the data?

What **criteria** do I need to group my data by?

# Grouping data

What **data** do I have?

What do you **need** from the data?

What **criteria** do I need to group my data by?

Details of people visiting different venues in a town,  
Month,  
Venue,  
Number of visitors

“I need to know the **total number of visitors in each month**”

Grouped **by month** then calculate the **total**

# Grouping data

“I need to know the **total number of visitors** in **each month**”

| month    | venue          | number_visitors |
|----------|----------------|-----------------|
| January  | Café           | 300             |
| January  | Ice cream shop | 50              |
| January  | Restaurant     | 2,500           |
| February | Café           | 200             |
| February | Ice cream shop | 40              |
| February | Restaurant     | 1,000           |

Group by **month**  
Then **summarise**

| month    | total_number_visitors |
|----------|-----------------------|
| January  | 2,850                 |
| February | 1,240                 |

# Your turn...

You need to calculate the **total\_sales** grouped by different criteria.

Can you think of some criteria you could use to group this dataset? e.g. group by price

| product      | colour | type      | price | sales  |
|--------------|--------|-----------|-------|--------|
| Apple        | Pink   | Fruit     | £1.00 | £53.00 |
| Banana       | Yellow | Fruit     | £0.50 | £40.50 |
| Carrot       | Orange | Vegetable | £0.50 | £37.00 |
| Dragon fruit | Pink   | Fruit     | £1.00 | £15.00 |
| Pepper       | Yellow | Vegetable | £0.50 | £12.50 |

# Your turn...

| product      | colour | type      | price | sales  |
|--------------|--------|-----------|-------|--------|
| Apple        | Pink   | Fruit     | £1.00 | £53.00 |
| Banana       | Yellow | Fruit     | £0.50 | £40.50 |
| Carrot       | Orange | Vegetable | £0.50 | £37.00 |
| Dragon fruit | Pink   | Fruit     | £1.00 | £15.00 |
| Pepper       | Yellow | Vegetable | £0.50 | £12.50 |

It could be grouped by:

- Colour
- Type
- Price

| colour | total_sales |
|--------|-------------|
| Pink   | £68.00      |
| Yellow | £53.00      |
| Orange | £37.00      |

| type      | total_sales |
|-----------|-------------|
| Fruit     | £108.50     |
| Vegetable | £49.50      |

| price | total_sales |
|-------|-------------|
| £1.00 | £68.00      |
| £0.50 | £90.00      |

# How to group a dataset in Excel

We are now going to look at **how to group this dataset in Excel** and calculate,

- Number of sales by month (Count)
- Total sales by month (Sum)

|    | A     | B       | C     |  |
|----|-------|---------|-------|--|
| 1  | month | item    | sales |  |
| 2  | Jan   | Jumper  | £25   |  |
| 3  | Jan   | Shoes   | £10   |  |
| 4  | Jan   | Socks   | £5    |  |
| 5  | Jan   | T-shirt | £8    |  |
| 6  | Feb   | Jumper  | £30   |  |
| 7  | Feb   | Scarf   | £20   |  |
| 8  |       |         |       |  |
| 9  |       |         |       |  |
| 10 |       |         |       |  |

# Setting up a grouped dataset in Excel

Step 1.

Create a new dataset with the variable headings and the data items you want to group by, in this case by **month**.

|    | A     | B       | C     | D | E     | F         | G           |
|----|-------|---------|-------|---|-------|-----------|-------------|
| 1  | month | item    | sales |   | month | num_sales | total_sales |
| 2  | Jan   | Jumper  | £25   |   | Jan   |           |             |
| 3  | Jan   | Shoes   | £10   |   | Feb   |           |             |
| 4  | Jan   | Socks   | £5    |   | Mar   |           |             |
| 5  | Jan   | T-shirt | £8    |   |       |           |             |
| 6  | Feb   | Jumper  | £30   |   |       |           |             |
| 7  | Feb   | Scarf   | £20   |   |       |           |             |
| 8  |       |         |       |   |       |           |             |
| 9  |       |         |       |   |       |           |             |
| 10 |       |         |       |   |       |           |             |

# COUNTIF

Step 2.

As we want to count the number of sales by month, we can use an Excel function COUNTIF.

**=countif**(Where do you want to look?, What do you want to look for?)

# COUNTIF

**=countif**(Where do you want to look?, What do you want to look for?)

|   | A     | B       | C     | D | E     | F                  | G           |
|---|-------|---------|-------|---|-------|--------------------|-------------|
| 1 | month | item    | sales |   | month | num_sales          | total_sales |
| 2 | Jan   | Jumper  | £25   |   | Jan   | =COUNTIF(A2:A7,E2) |             |
| 3 | Jan   | Shoes   | £10   |   | Feb   |                    |             |
| 4 | Jan   | Socks   | £5    |   | Mar   |                    |             |
| 5 | Jan   | T-shirt | £8    |   |       |                    |             |
| 6 | Feb   | Jumper  | £30   |   |       |                    |             |
| 7 | Feb   | Scarf   | £20   |   |       |                    |             |
| 8 |       |         |       |   |       |                    |             |

Where do you want to look?

This formula looks for the string “Jan” in the cells A2 to A7 and returns the number of times it finds it.

# COUNTIF

Step 3.

Copy the formula and paste it into the remaining rows.

|     |       |         |       |   |       |                            |             |
|-----|-------|---------|-------|---|-------|----------------------------|-------------|
| SUM |       |         |       |   |       | =COUNTIF(\$A\$2:\$A\$7,E4) |             |
|     | A     | B       | C     | D | E     | F                          | G           |
| 1   | month | item    | sales |   | month | num_sales                  | total_sales |
| 2   | Jan   | Jumper  | £25   |   | Jan   | 4                          |             |
| 3   | Jan   | Shoes   | £10   |   | Feb   | 2                          |             |
| 4   | Jan   | Socks   | £5    |   | Mar   | =COUNTIF(\$A\$2:\$A\$7,E4) |             |
| 5   | Jan   | T-shirt | £8    |   |       |                            |             |
| 6   | Feb   | Jumper  | £30   |   |       |                            |             |
| 7   | Feb   | Scarf   | £20   |   |       |                            |             |
| 8   |       |         |       |   |       |                            |             |
| 9   |       |         |       |   |       |                            |             |
| 10  |       |         |       |   |       |                            |             |
| 11  |       |         |       |   |       |                            |             |
| 12  |       |         |       |   |       |                            |             |

# Relative vs. absolute cell references

When you type a formula that uses cell names (e.g. A2) in Excel it is looking at **where the cells are** compared to the formulas.

In this example, the formula is adding the 2 cells to its left.

When you copy the formula to another part of the sheet it is still adding the 2 cells to its left.

These are called **relative cell references**.

|   | A | B  | C      | D |
|---|---|----|--------|---|
| 1 |   |    |        |   |
| 2 | 5 | 10 | =A2+B2 |   |
| 3 |   |    |        |   |
| 4 |   |    |        |   |
| 5 |   |    |        |   |

|   | A | B  | C      | D      |
|---|---|----|--------|--------|
| 1 |   |    |        |        |
| 2 | 5 | 10 | =A2+B2 |        |
| 3 |   |    |        |        |
| 4 |   |    |        |        |
| 5 |   |    |        |        |
| 6 |   | 3  | 9      | =B6+C6 |
| 7 |   |    |        |        |

# Relative vs. absolute cell references

Relative cell references is the standard way Excel uses formulas, and most of the time is what you will need.

However there are some times when you want specific cell(s) to be used in a formula regardless of where you copy the formula too.

These are called **absolute cell references**.

The cell containing the VAT % is fixed and needs to be used in lots of different formulas.

|   | A     | B      | C              |
|---|-------|--------|----------------|
| 1 | VAT   | 20%    |                |
| 2 |       |        |                |
| 3 | item  | price  | price_inc_VAT  |
| 4 | hat   | £10.00 | £12.00         |
| 5 | top   | £15.00 | =B5*(1+\$B\$1) |
| 6 | shoes | £17.50 | £21.00         |
| 7 |       |        |                |
| 8 |       |        |                |

# Making cells absolute references

By **adding dollar signs (\$)** before the column letter and/or row number, it tells Excel not to change these references when copying and pasting the formula.

It makes the **cell reference absolute**.

=countif(A2:A7,E2)

=countif(\$A\$2:\$A\$7,E2)

See 'Switch between relative, absolute and mixed references' for more details.

[Microsoft support: switch between relative absolute and mixed references](#)

# Impact of the \$ signs in a formula

**Without \$ signs in the formula**

| =COUNTIF(A4:A9,E4) |       |         |       |   |       |                    |
|--------------------|-------|---------|-------|---|-------|--------------------|
|                    | A     | B       | C     | D | E     | F                  |
| 1                  | month | item    | sales |   | month | num_sales          |
| 2                  | Jan   | Jumper  | £25   |   | Jan   | 4                  |
| 3                  | Jan   | Shoes   | £10   |   | Feb   | 2                  |
| 4                  | Jan   | Socks   | £5    |   | Mar   | =COUNTIF(A4:A9,E4) |
| 5                  | Jan   | T-shirt | £8    |   |       |                    |
| 6                  | Feb   | Jumper  | £30   |   |       |                    |
| 7                  | Feb   | Scarf   |       |   |       |                    |
| 8                  |       |         |       |   |       |                    |
| 9                  |       |         |       |   |       |                    |
| 10                 |       |         |       |   |       |                    |

The formula is looking in cells A4 to A9 rather than A2 to A7.

**With \$ signs in the formula**

| =COUNTIF(\$A\$2:\$A\$7,E4) |       |         |       |   |       |                            |
|----------------------------|-------|---------|-------|---|-------|----------------------------|
|                            | A     | B       | C     | D | E     | F                          |
| 1                          | month | item    | sales |   | month | num_sales                  |
| 2                          | Jan   | Jumper  | £25   |   | Jan   | 4                          |
| 3                          | Jan   | Shoes   | £10   |   | Feb   | 2                          |
| 4                          | Jan   | Socks   | £5    |   | Mar   | =COUNTIF(\$A\$2:\$A\$7,E4) |
| 5                          | Jan   | T-shirt | £8    |   |       |                            |
| 6                          | Feb   | Jumper  | £30   |   |       |                            |
| 7                          | Feb   | Scarf   | £20   |   |       |                            |
| 8                          |       |         |       |   |       |                            |
| 9                          |       |         |       |   |       |                            |
| 10                         |       |         |       |   |       |                            |

By adding the \$ signs into the formulas, when the formula has been copied it is still referencing the cells we want.

## Next steps

Complete **questions 1 to 9**  
in **section 2** of the  
'Summarising datasets in  
Excel' workbook.

# More on grouping

As well as counting by a group you can calculate the total, average, maximum or minimum in a group.

| Calculation    | Formula  |
|----------------|--|
| Total          | =sumifs(sum_range, range, criteria)                  |
| Average (mean) | =averageifs(average_range, criteria_range, criteria) |
| Maximum        | =maxifs(max_range, criteria_range, criteria)         |
| Minimum        | =minifs(max_range, criteria_range, criteria)         |

# SUMIFS

In this dataset we are looking to create a variable **total\_sales** grouped by **month**.

**=sumifs(sum\_range, range, criteria)**

| SUM                                     |       |         |       |   |       |           |   |
|---|-------|---------|-------|---|-------|-----------|---|
| =SUMIFS(\$C\$2:\$C\$7,\$A\$2:\$A\$7,E3) |       |         |       |   |       |           |   |
|   | A     | B       | C     | D | E     | F         | G                                       |
| 1                                       | month | item    | sales |   | month | num_sales | total_sales                             |
| 2                                       | Jan   | Jumper  | £25   |   | Jan   | 4         | £48                                     |
| 3                                       | Jan   | Shoes   | £10   |   | Feb   | 2         | =SUMIFS(\$C\$2:\$C\$7,\$A\$2:\$A\$7,E3) |
| 4                                       | Jan   | Socks   | £5    |   | Mar   | 0         | £0                                      |
| 5                                       | Jan   | T-shirt | £8    |   |       |           |   |
| 6                                       | Feb   | Jumper  | £30   |   |       |           |   |
| 7                                       | Feb   | Scarf   | £20   |   |       |           |   |

**range**  
where you want to look

**sum\_range**  
what you want to add up

**criteria**  
what you are looking for?

Next steps

Complete **questions 1 to 8**  
in **section 3** of the  
'Summarising datasets in  
Excel' workbook.

# Summarising with missing values

Datasets can often **contain missing or blank values**. This can cause issues when you are summarising them.

How you handle these missing values can impact on your final results.

# Summarising with missing values

If a dataset has missing values you can,

- Put a **value such as NA** (Not Available), **NaN** (Not a Number) or **NULL**
- **Remove the row**

With both of these options you need to be careful when you go on to summarise the dataset.

| ID     | test_1 | test_2 | test_3 |
|--------|--------|--------|--------|
| GH1254 | 50%    | 36%    | 72%    |
| SE1547 | 45%    | 64%    | 94%    |
| DM4758 | 90%    | 48%    | 78%    |
| KL4758 | 32%    | 93%    | 52%    |
| PM4575 | 85%    | NA     | NA     |

# Show me...

Option 1: Put a **value** such as NA, NaN or NULL

| ID             | test_1     | test_2     | test_3     |
|----------------|------------|------------|------------|
| GH1254         | 50%        | 36%        | 72%        |
| SE1547         | 45%        | 64%        | 94%        |
| DM4758         | 90%        | 48%        | 78%        |
| KL4758         | 32%        | 93%        | 52%        |
| PM4575         | 85%        | NA         | NA         |
| <b>Average</b> | <b>60%</b> | <b>60%</b> | <b>74%</b> |

Option 2: **Remove row** containing ID PM4575

| ID             | test_1     | test_2     | test_3     |
|----------------|------------|------------|------------|
| GH1254         | 50%        | 36%        | 72%        |
| SE1547         | 45%        | 64%        | 94%        |
| DM4758         | 90%        | 48%        | 78%        |
| KL4758         | 32%        | 93%        | 52%        |
| <b>Average</b> | <b>54%</b> | <b>60%</b> | <b>74%</b> |

The two options have produced different answers for **test\_1**.

# Summarising with missing values

Before you decide which option to use when handling missing values, it helps to think about these questions.

Why is there a missing value?

If you remove the row will you lose information?

Is the missing value likely to be added in later?

# Example

Calculate the **average price** of these video games.

| video_game                   | price |
|------------------------------|-------|
| Super Mario Odyssey          | 39.99 |
| Call of Duty: Modern Warfare | 27.99 |
| Mario Kart 8 Deluxe          | 39.99 |
| Hades                        | ?     |
| Overcooked! All You Can Eat  | 22.85 |

# Example

For this dataset, the row with the missing data has been **removed** before the average has been calculated.

No information about the price of the games has been lost by removing the row.

| video_game                   | price |
|------------------------------|-------|
| Super Mario Odyssey          | 39.99 |
| Call of Duty: Modern Warfare | 27.99 |
| Mario Kart 8 Deluxe          | 39.99 |
| Hades                        | ?     |
| Overcooked! All You Can Eat  | 22.85 |

| video_game            | average_price |
|-----------------------|---------------|
| All excluding "Hades" | 32.71         |

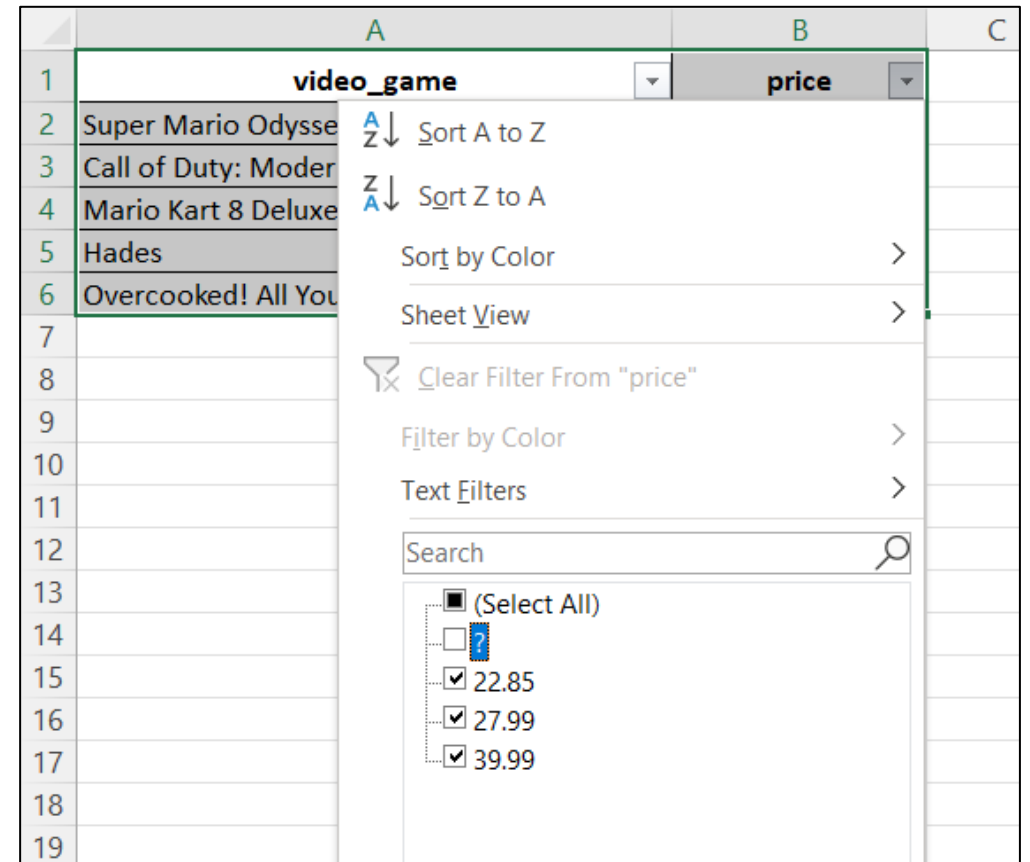

# Removing rows from a dataset in Excel

## Step 1.

To remove a row of data from a dataset in Excel, you need to follow the same steps as for **filtering data**.

Reminder: to turn on filters on dataset you need to press,

|         |                    |
|---------|--------------------|
| Windows | Ctrl + Shift + L   |
| Mac     | Command + Shift +L |

# Removing rows from a dataset in Excel

Step 2.

Once you have turned on the filter, you need to select just the **rows that don't have missing values**.

Then **copy and paste** the filtered rows into a new part of the workbook.

You can now **summarise** the dataset.

|    | A                            | B            |
|----|------------------------------|--------------|
| 1  | <b>video_game</b>            | <b>price</b> |
| 2  | Super Mario Odyssey          | £39.99       |
| 3  | Call of Duty: Modern Warfare | £27.99       |
| 4  | Mario Kart 8 Deluxe          | £39.99       |
| 6  | Overcooked! All You Can Eat  | £22.85       |
| 7  |                              |              |
| 8  |                              |              |
| 9  |                              |              |
| 10 | <b>video_game</b>            | <b>price</b> |
| 11 | Super Mario Odyssey          | £39.99       |
| 12 | Call of Duty: Modern Warfare | £27.99       |
| 13 | Mario Kart 8 Deluxe          | £39.99       |
| 14 | Overcooked! All You Can Eat  | £22.85       |
| 15 | Average price                | £32.71       |
| 16 |                              |              |

# Learning checklist

I can *describe* how to summarise rows of data.

I can *describe* how to group rows of data based on logical criteria.

I can *group* and *summarise* rows of data in Excel.
